## Outline

- Dispersion relation for self-energy
- Self-energy and nucleon optical potential
- Description of elastic nucleon scattering
- Empirical information on optical potentials
- Subtracted dispersion relation
- Discussion of time and space nonlocality
- Dispersive optical model fits for  $^{40}\text{Ca}$  and  $^{48}\text{Ca}$
- Extrapolation to the dripline
- Data-driven extrapolations & missing data
- Inclusion of nonlocal potentials

# Theory & Framework

Theory  
hard...

- Calculations: Include SRC and LRC as good as possible
- Compare with experiment; add more physics

Framework  
"easy"

- Determine propagator from data!?!
- Illustrated with  $(e,e'p)$  reaction below the Fermi energy
- Today also elastic scattering data

Answers:

What do nucleons do in the nucleus  
and how does their behavior change  
as a function of asymmetry

# Correlations for nuclei with $N$ very different from $Z$ ? ⇒ Radioactive beam facilities

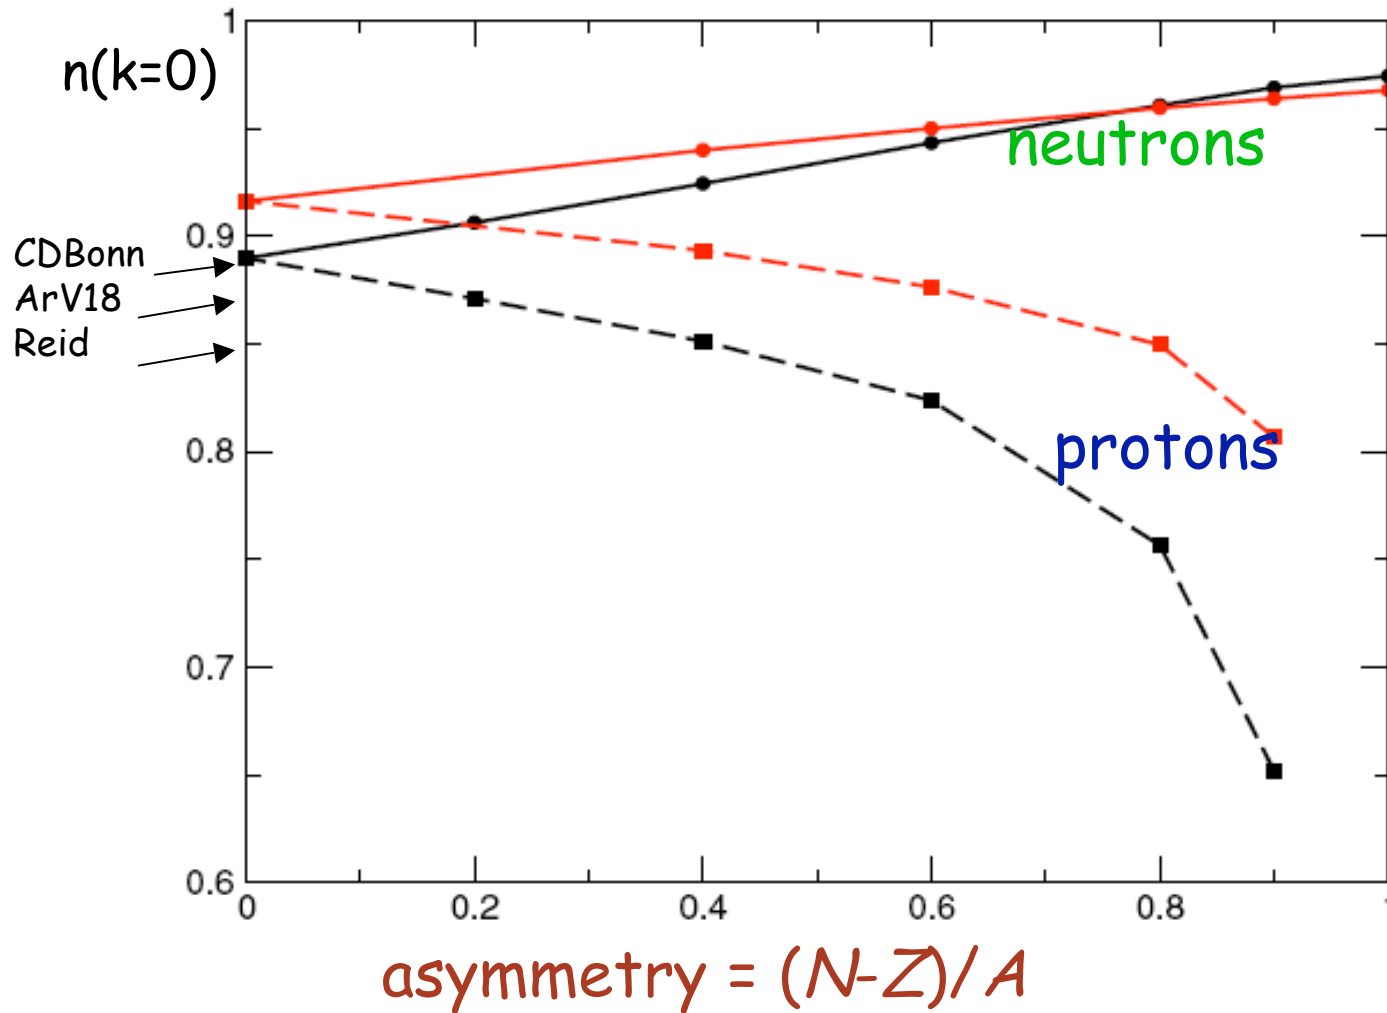

Nuclei are TWO-component Fermi liquids

- SRC about the same between pp, np, and nn
- Tensor force disappears for n when  $N \gg Z$  but ...
- Empirically p more bound with increasing asymmetry  $(N-Z)/A$
  
- Any surprises?
- Ideally: quantitative predictions based on solid foundation

Some pointers: one from theory and one from experiment

# SCGF for isospin-polarized nuclear matter including SRC $\Rightarrow$ momentum distribution

Frick *et al.*  
PRC71,014313(2005)

$0.16 \text{ fm}^{-3}$

$0.32 \text{ fm}^{-3}$

SRC  
can be handled

# A. Gade et al., Phys. Rev. Lett. 93, 042501 (2004)

Program at MSU initiated by Gregers Hansen

P. G. Hansen and J. A. Tostevin, Annu. Rev. Nucl. Part. Sci. **53**, 219 (2003)

neutrons more correlated with increasing proton number and accompanying increasing separation energy.

# Dyson Equation and "experiment"

Equivalent to ...

Schrödinger-like equation with:  $E_n^- = E_0^N - E_n^{N-1}$

**Self-energy:** non-local, energy-dependent potential  
 With energy dependence: spectroscopic factors  $< 1$   
 $\Rightarrow$  as observed in (e,e'p)

$$-\frac{\hbar^2 \nabla^2}{2m} \langle \Psi_n^{N-1} | a_{\vec{r}m} | \Psi_0^N \rangle + \sum_{m'} \int d\vec{r}' \Sigma'^*(\vec{r}m, \vec{r}'m'; E_n^-) \langle \Psi_n^{N-1} | a_{\vec{r}'m'} | \Psi_0^N \rangle = E_n^- \langle \Psi_n^{N-1} | a_{\vec{r}m} | \Psi_0^N \rangle$$

$$S = \left| \langle \Psi_n^{N-1} | a_{\alpha_{qh}} | \Psi_0^N \rangle \right|^2 = \frac{1}{1 - \left. \frac{\partial \Sigma^*(\alpha_{qh}, \alpha_{qh}; E)}{\partial E} \right|_{E_n^-}}$$

$\alpha_{qh}$  solution of DE at  $E_n^-$

DE yields

$$\langle \Psi_n^{N-1} | a_{\vec{r}m} | \Psi_0^N \rangle = \psi_n^{N-1}(\vec{r}m)$$

$$\langle \Psi_0^N | a_{\vec{r}m} | \Psi_k^{N+1} \rangle = \psi_k^{N+1}(\vec{r}m)$$

$$\langle \Psi_E^{c,N-1} | a_{\vec{r}m} | \Psi_0^N \rangle = \chi_c^{N-1}(\vec{r}m; E)$$

$$\langle \Psi_0^N | a_{\vec{r}m} | \Psi_E^{c,N+1} \rangle = \chi_c^{N+1}(\vec{r}m; E)$$

Bound states in N-1

Bound states in N+1

Scattering states in N-1

Elastic scattering in N+1

Elastic scattering wave function for (p,p) or (n,n)

Does the nucleon self-energy also have an imaginary part above the Fermi energy?

Loss of flux in the elastic channel

Answer: YES!

# FRAMEWORK FOR EXTRAPOLATIONS BASED ON EXPERIMENTAL DATA

"Mahaux analysis"  $\Rightarrow$  Dispersive Optical Model (DOM)

C. Mahaux and R. Sartor, *Adv. Nucl. Phys.* **20**, 1 (1991)

- There is empirical information about the nucleon self-energy!!
- $\Rightarrow$  Optical potential to analyze elastic nucleon scattering data
- $\Rightarrow$  Extend analysis from  $A+1$  to include structure information in  $A-1 \Rightarrow (e,e'p)$  data
- $\Rightarrow$  Employ dispersion relation between real and imaginary part of self-energy

Recent extension

Combined analysis of protons in  $^{40}\text{Ca}$  and  $^{48}\text{Ca}$

Charity, Sobotka, & WD nucl-ex/0605026, *Phys. Rev. Lett.* **97**, 162503 (2006)

Charity, Mueller, Sobotka, & WD, *Phys. Rev. C* (2007) submitted

Large energy window ( $> 200$  MeV)

- Goal: Extract asymmetry dependence  $\Rightarrow \delta = (N - Z)/A$
- $\Rightarrow$  **Predict** proton properties at large asymmetry  $\Rightarrow ^{60}\text{Ca}$
  - $\Rightarrow$  **Predict** neutron properties ... the dripline  
**based on data!**

## General dispersion relation

$$\operatorname{Re} \Sigma(\gamma, \delta; E) = \Sigma^{\text{HF}}(\gamma, \delta) - \frac{1}{\pi} P \int_{E_T^+}^{\infty} dE' \frac{\operatorname{Im} \Sigma(\gamma, \delta; E')}{E - E'} + \frac{1}{\pi} P \int_{-\infty}^{E_T^-} dE' \frac{\operatorname{Im} \Sigma(\gamma, \delta; E')}{E - E'}$$

At  $E_0$  for example the Fermi energy

$$\operatorname{Re} \Sigma(\gamma, \delta; E_0) = \Sigma^{\text{HF}}(\gamma, \delta) - \frac{1}{\pi} P \int_{E_T^+}^{\infty} dE' \frac{\operatorname{Im} \Sigma(\gamma, \delta; E')}{E_0 - E'} + \frac{1}{\pi} P \int_{-\infty}^{E_T^-} dE' \frac{\operatorname{Im} \Sigma(\gamma, \delta; E')}{E_0 - E'}$$

Subtract

"HF" from Mahaux

$$\operatorname{Re} \Sigma(\gamma, \delta; E) = \operatorname{Re} \Sigma(\gamma, \delta; E_0)$$

$$-\frac{1}{\pi} (E_0 - E) P \int_{E_T^+}^{\infty} dE' \frac{\operatorname{Im} \Sigma(\gamma, \delta; E')}{(E - E')(E_0 - E')} + \frac{1}{\pi} (E_0 - E) P \int_{-\infty}^{E_T^-} dE' \frac{\operatorname{Im} \Sigma(\gamma, \delta; E')}{(E - E')(E_0 - E')}$$

Note here:  $\operatorname{Im} \Sigma < 0$  for "2p1h" energies but  $> 0$  for "2h1p" energies

## Diagonal approximation

Further simplification: assume no mixing between major shells

$$\Sigma^{(2)}(\alpha; E) = \frac{1}{2} \left\{ \sum_{p_1 p_2 h_3} \frac{|\langle \alpha h_3 | V | p_1 p_2 \rangle|^2}{E - (\varepsilon_{p_1} + \varepsilon_{p_2} - \varepsilon_{h_3}) + i\eta} + \sum_{h_1 h_2 p_3} \frac{|\langle \alpha p_3 | V | h_1 h_2 \rangle|^2}{E - (\varepsilon_{h_1} + \varepsilon_{h_2} - \varepsilon_{p_3}) - i\eta} \right\}$$

Corresponding Dyson equation

$$G(\alpha; E) = G^{HF}(\alpha; E) + G(\alpha; E) \Sigma^{(2)}(\alpha; E) G^{HF}(\alpha; E) = \frac{1}{E - \varepsilon_\alpha - \Sigma^{(2)}(\alpha; E)}$$

Assume discrete poles in  $\Sigma$ , then discrete solution (poles of  $G$ ) for

$$E_{n\alpha} = \varepsilon_\alpha + \Sigma^{(2)}(\alpha; E_{n\alpha})$$

With residue (spectroscopic factor)

$$R_{n\alpha} = \frac{1}{1 - \left. \frac{\partial \Sigma^{(2)}(\alpha; E)}{\partial E} \right|_{E_{n\alpha}}}$$

## Employed equations

$$\Sigma(rm, r' m'; E) \Rightarrow \mathcal{U}(r, E) = -\mathcal{V}(r, E) + V_{so}(r) + V_C(r) \\ - iW_v(E) f(r, r_v, a_v) + 4ia_s W_s(E) f'(r, r_s, a_s)$$

$$f(r, r_i, a_i) = \left( 1 + e^{\frac{r-r_i A^{1/3}}{a_i}} \right)^{-1}$$

Woods-Saxon form factor

$$\mathcal{V}(r, E) = V_{HF}(E) f(r, r_{HF}, a_{HF}) + \Delta \mathcal{V}(r, E)$$

"HF" includes main effect of nonlocality  
 $\Rightarrow$  *k*-mass

$$\Delta \mathcal{V}(r, E) = \Delta V_v(E) f(r, r_v, a_v) - 4a_s \Delta V_s(E) f'(r, r_s, a_s)$$

"Time" nonlocality  
 $\Rightarrow$  *E*-mass

$$\Delta V_i(E) = \frac{P}{\pi} \int_{-\infty}^{\infty} W_i(E') \left( \frac{1}{E' - E} - \frac{1}{E' - E_F} \right) dE'$$

Subtracted dispersion relation  
 equivalent to earlier slide

## Features of simultaneous fit to $^{40}\text{Ca}$ and $^{48}\text{Ca}$ data

- Surface contribution assumed symmetric around  $E_F$ 
  - Represents coupling to low-lying collective states (GR)
- Volume term asymmetric w.r.t.  $E_F$  taken from nuclear matter
- Geometric parameters  $r_i$  and  $a_i$  fit but the same for both nuclei
- Decay (in energy) of surface term identical also
- Possible to keep volume term the same (consistent with exp) and independent of asymmetry
- $HF$  and surface parameters different and can be extrapolated to larger asymmetry
- Surface potential stronger and narrower around  $E_F$  for  $^{48}\text{Ca}$

# Locality and other approximations

Mahaux  $V_{HF}(\vec{r}m, \vec{r}'m') = \text{Re} \Sigma(\vec{r}m, \vec{r}'m'; E_F) \Rightarrow V_{HF}(r; E) = U_{HF}(E) f(X_{HF})$

with  $f(X_{HF}) = [1 + \exp(X_{HF})]^{-1}$

$$X_{HF} = \frac{r - R_{HF}}{a_{HF}}$$

$$R_{HF} = r_{HF} A^{1/3}$$

$$U_{HF}(E) = U_{HF}(E_F) + \left[ 1 - \frac{m_{HF}^*}{m} \right] (E - E_F)$$

- Dispersive part: - assumed large  $E$  contribution and  $m_{HF}^*$  correlated  
 $\Rightarrow$  can use nuclear matter model  
and introduces asymmetry in Im part  
- nonlocality of Im  $\Sigma$  smooth  
 $\Rightarrow$  replace by local form identified with the  
imaginary part of the optical-model potential  
with volume and surface contributions

## Infinite matter self-energy

Real and imaginary part of the (retarded) self-energy

- $k_F = 1.35 \text{ fm}^{-1}$
- $T = 5 \text{ MeV}$
- $k = 1.14 \text{ fm}^{-1}$

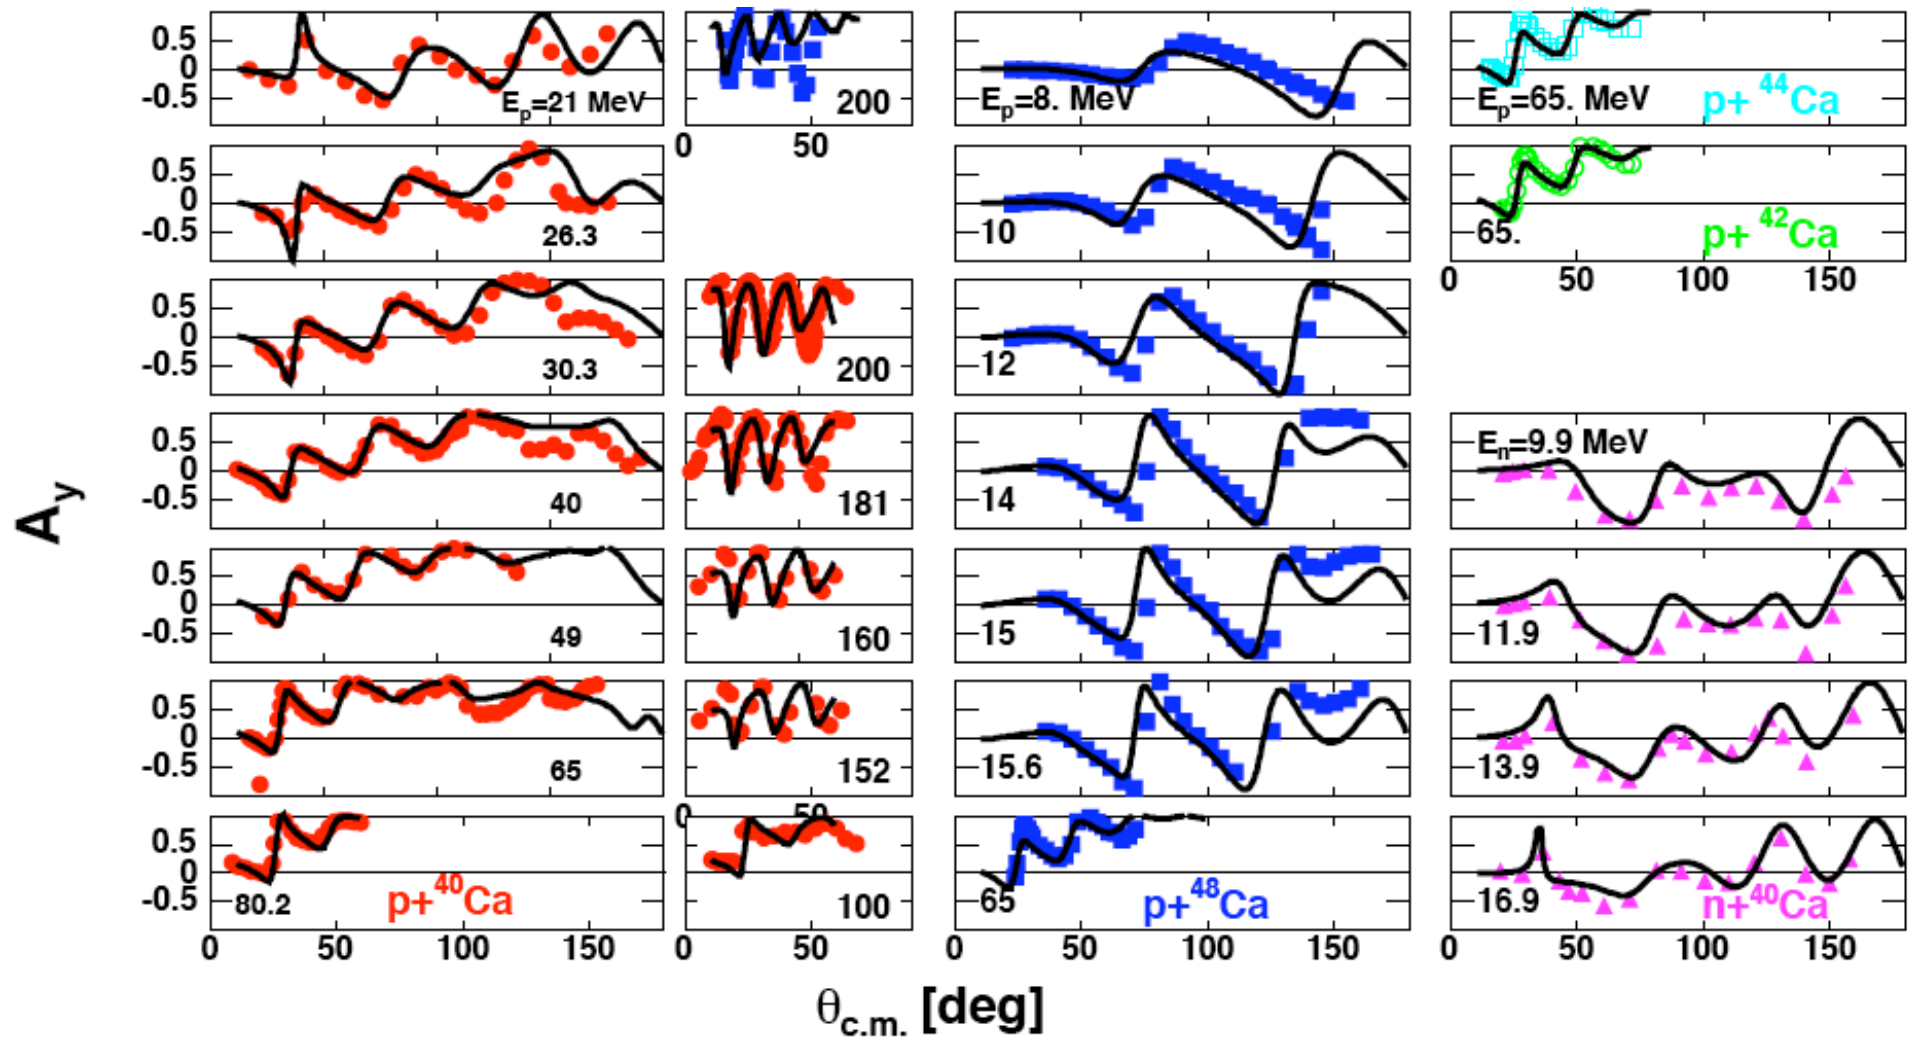

Note differences due to  $NN$  interaction

Asymmetry w.r.t. the Fermi energy related to phase space for  $p$  and  $h$

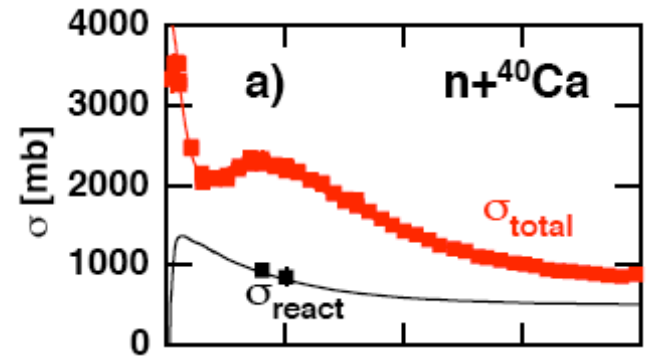

# Present fit and predictions of polarization data

## Spin rotation parameter (not fitted)

# Fit and predictions Of reaction cross sections

# Present fit to (e,e'p) data

radii of  
bound state  
wave functions

spectroscopic  
factors

widths of strength  
distribution

# Potentials

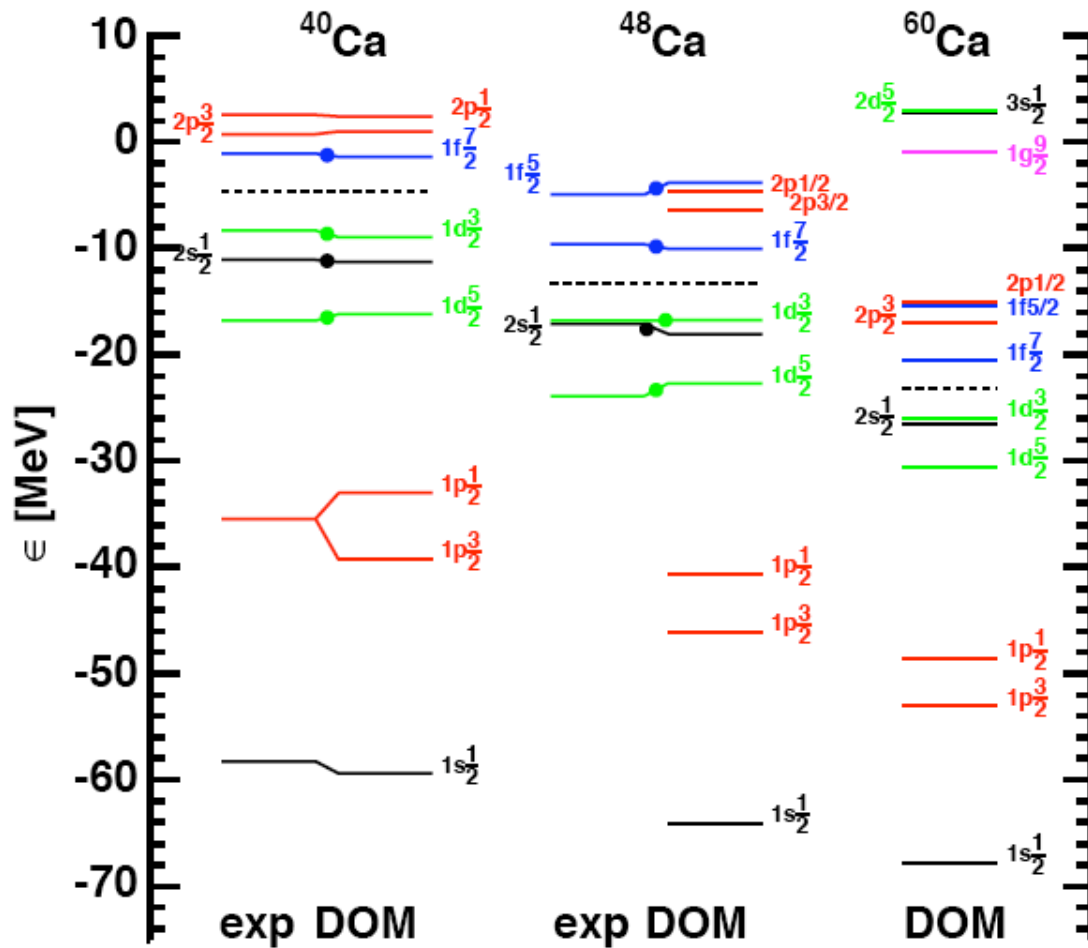

Surface potential strengthens with increasing asymmetry for protons

# Volume integrals

# Proton single-particle structure and asymmetry

Pairing of protons due to  $pn$  correlations?!

Increased correlations with increasing asymmetry!

# What's the physics? GT resonance?

PRC31,1161(1985)

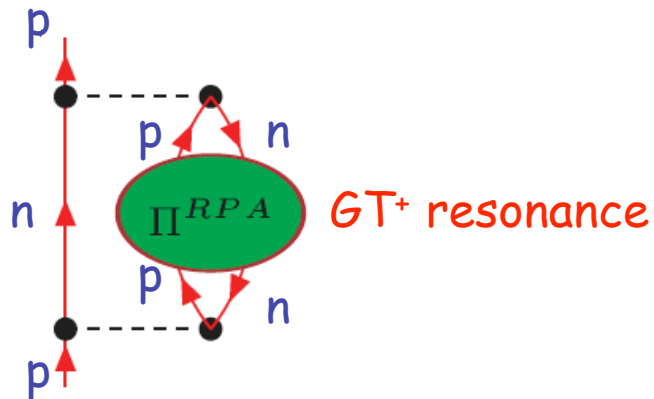

NPA369,258(1981)

# Influence of Gamow-Teller Giant Resonance or $\sigma_1 \cdot \sigma_2 \tau_1 \cdot \tau_2$ (& tensor force) ph interaction

Sum rule for strength:  $S(\beta^+) - S(\beta^-) = 3(N - Z)$

For  $N > Z$  only p affected

For  $Z > N$  only n affected

Related issue:

Change in magic numbers with increasing asymmetry  
e.g. Otsuka et al., Phys. Rev. Lett. 95, 232502 (2005)

# Extrapolation in $\delta$

Naïve:  $p/n \Rightarrow D_1 \Rightarrow \pm (N-Z)/A$

Cannot be extrapolated for n

Less naïve:

$D_2 \Rightarrow p \Rightarrow +(N-Z)/A$

$D_2 \Rightarrow n \Rightarrow 0$

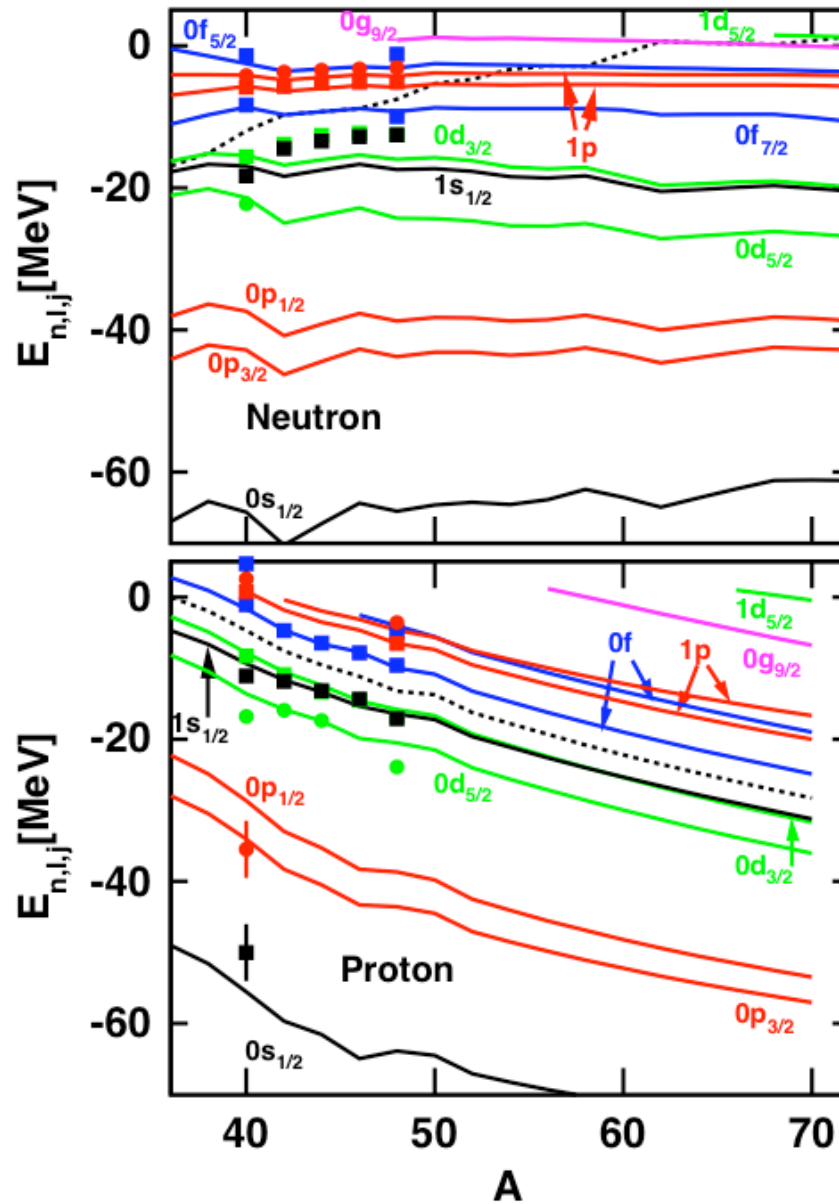

Emphasizes coupling to GT resonance  
Consistent with  $n+{}^A\text{Mo}$  data

Need  $n+{}^{48}\text{Ca}$  elastic scattering data!!!

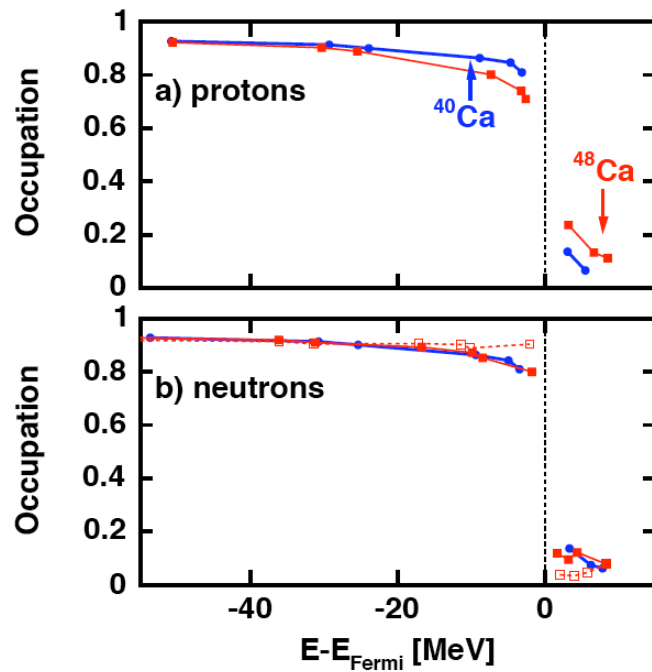

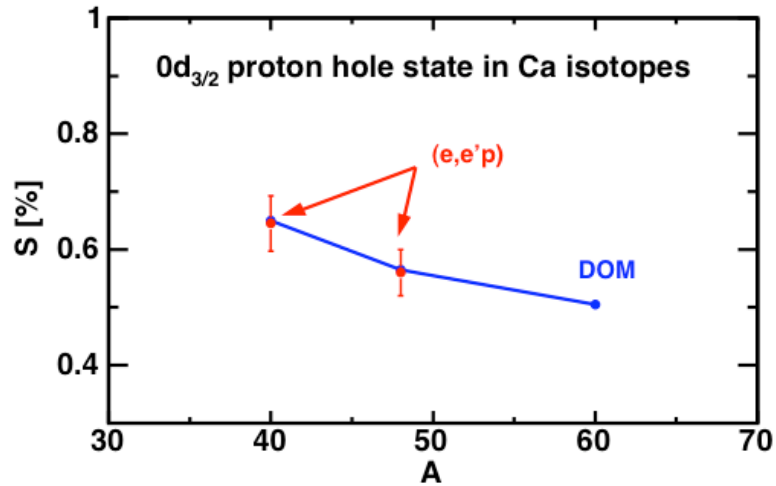

# Extrapolation for large N of sp levels

Old  $^{48}\text{Ca}(p,pn)$  data  
J.W.Watson et al.  
Phys. Rev. C26,961 (1982)  
~ consistent with DOM

# Spectroscopic factors as a function of $\delta$

## Occupation numbers

Protons more correlated with  $\delta$

Neutrons not much change

# Driplines

Proton dripline wrong by 1

Neutron dripline more complicated:

$^{60}\text{Ca}$  and  $^{70}\text{Ca}$  particle bound  
 Intermediate isotopes unbound  
 Reef?

# Outlook

- Explore the Gamow-Teller connection
  - link with excited states
- More experimental information from elastic nucleon scattering is important!
  - lots of informative experiments to be done with radioactive beams
- Neutron experiments on  $^{48}\text{Ca}$  and  $^{48}\text{Ca}(p,d)$  in the  $^{47}\text{Ca}$  continuum
- Data-driven extrapolations to the neutron dripline
  
- More DOM analysis
- Exact solution of the Dyson equation with nonlocal potentials (in progress)
- Employ information of nucleon self-energy to generate functionals for  
QP-DFT = Quasi-Particle Density Functional Theory (Van Neck et al.  $\Rightarrow$  PRA)  
DFT that includes a correct description of QP properties!!

# Inclusion of $V_{NN}$ (or parts of it)

## Self-energy

Requires one-body density matrix  
Already "determined" from experiment  
Can take explicit realistic tensor force  $V_T$   
Refit to data  
Useful for asymmetry dependence!

See also  
Otsuka, Matsuo, and Abe,  
PRL97, 162501 (2006)

# Improvements in progress

Replace treatment of nonlocality in terms of local equivalent but energy-dependent potential by explicitly nonlocal potential

⇒ Necessary for exact solution of Dyson equation

- Yields complete spectral density as a function of energy
- Yields one-body density
- Yields natural orbits
- Yields charge density
- Yields neutron density
- Data for charge density can be included in fit
- Data for  $(e,e'p)$  cross sections near  $E_F$  can be included in fit
- High-momentum components can be included (Jlab data)
- $E/A$  can be calculated/ used as constraint ⇒ TNI
- NN Tensor force can be included explicitly
- Generate functionals for QP-DFT

OK  
OK  
OK  
OK  
OK

## Exact solution of Dyson equation

Coordinate space technique employed for atoms can be employed to solve Dyson equation including any true nonlocality (Van Neck)

Yields

$$S_h(\alpha, \beta; E) = \sum_n \langle \Psi_0^N | a_\beta^\dagger | \Psi_n^{N-1} \rangle \langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle \delta(E - (E_0^N - E_n^{N-1}))$$

spectral density (spectral function for  $\alpha = \beta$ ) and therefore

$$n(\beta, \alpha) = \int_{-\infty}^{\varepsilon_{\bar{F}}} dE S_h(\alpha, \beta; E) = \sum_n \langle \Psi_0^N | a_\beta^\dagger | \Psi_n^{N-1} \rangle \langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle = \langle \Psi_0^N | a_\beta^\dagger a_\alpha | \Psi_0^N \rangle$$

the one-body density matrix including occupation numbers ( $\alpha = \beta$ ), charge density, etc. and last but not least

$$\begin{aligned} E_0^N &= \frac{1}{2} \left( \sum_{\alpha, \beta} \langle \alpha | T | \beta \rangle n(\alpha, \beta) + \sum_{\alpha} \int_{-\infty}^{\varepsilon_{\bar{F}}} dE E S_h(\alpha; E) \right) \\ &= \frac{1}{2} \left( \sum_{\ell_j} \int_0^{\infty} dk k^2 (2j+1) \frac{\hbar^2 k^2}{2m} n_{\ell_j}(k) + \sum_{\ell_j} (2j+1) \int_0^{\infty} dk k^2 \int_{-\infty}^{\varepsilon_{\bar{F}}} dE E S_{\ell_j}(k; E) \right) \end{aligned}$$

the ground state energy  $\Rightarrow$  useful constraints (includes also  $Z$  &  $N$ )

# Charge density & High-momentum components

$^{40}\text{Ca}$

$k^2 n(k)$

Only 2% high-momentum strength  
 $\Rightarrow$  Modify self-energy to include more high-momentum strength  
Consistent with theoretical experience and Jlab data!

# Summary

- Proton sp properties in stable closed-shell nuclei understood (mostly)

Study of  $N \neq Z$  nuclei based on DOM framework and experimental data

- Description of huge amounts of data
- Sensible extrapolations to systems with large asymmetry
- More data necessary to improve/pin down extrapolation
- More theory

## Predictions

- $N \neq Z$  p more correlated while n similar (for  $N > Z$ ) and vice versa
- Proton closed-shells with  $N \gg Z \Rightarrow$  may favor pp pairing
- Neutron dripline may be more complicated (reef)

# Deep-inelastic neutron scattering off quantum liquids

# New framework to do self-consistent sp theory

Quasiparticle density functional theory  $\Rightarrow$  QP-DFT

D. Van Neck et al., Phys. Rev. A74, 042501 (2006)

Ground-state energy and one-body density matrix from **self-consistent sp equations** that extend the Kohn-Sham scheme.

Based on separating the propagator into a quasiparticle part and a background, expressing only the latter as a functional of the density matrix.  
 $\Rightarrow$  **in addition yields qp energies and overlap functions**

Reminder: DFT does not yield removal energies of atoms

| Relative deviation [%] |         |    | DFT  | HF  |
|------------------------|---------|----|------|-----|
|                        | He atom | 1s | 37.4 | 1.5 |
|                        | Ne atom | 2p | 38.7 | 6.8 |
|                        | Ar atom | 3p | 36.1 | 2.0 |

While ground-state energies are closer to exp in DFT than in HF

**Can be developed for nuclei from DOM input!**

# Isospin analysis
